SUMMARY

I plan before I build, read the documentation before I implement, and treat AI output as a first draft that needs direction — not an answer that needs acceptance. When something I've built contradicts what the product is actually for, I catch it and rebuild it. The projects below are the proof.

SELECTED PROJECTS

Spottr — Gym Community Mobile App

React Native · Expo · Supabase · Next.js

A real-time social layer for gyms — lets co-present members signal openness and exchange one introductory message, solving the mutual hesitation that stops gym-goers from connecting.

- Caught that the original status feature forced users to publicly label their experience level — the exact social anxiety the app exists to remove. Rebuilt it around mood and a separate opt-in availability toggle.
- Architected three coordinated systems: a React Native mobile app, a Next.js admin portal with role-scoped views, and a Supabase backend.
- Encoded all safety rules at the database layer via PostgreSQL Row Level Security — blocks enforced by RLS so blocked users return nothing, one-intro limit enforced by a UNIQUE constraint, not application code.
- Built GPS-verified check-in (proximity only, never stored), realtime presence, push notifications, automated checkout, and a scheduled data-retention policy.

MotorShop — E-Commerce Platform

Next.js · TypeScript · PostgreSQL · Docker

Full-stack motorcycle-parts store with vehicle fitment search. Built as a deliberate exercise in assembling a real application correctly.

- Built Year/Make/Model fitment search, category filtering, authentication, cart, and order flows — modeling a real commerce domain, not copying a tutorial.
 - Containerized local dev with Docker; deployed on Vercel after a pragmatic cost/complexity evaluation for a portfolio project.
 - Every technology choice has a documented reason.
-

TECHNICAL SKILLS

Languages	TypeScript, JavaScript, SQL
Frontend	React, React Native (Expo), Next.js, Astro
Backend & Data	PostgreSQL, Supabase, Row Level Security, REST APIs, Auth
Tooling	Docker, Git/GitHub, Vercel, EAS Build
AI Workflow	Claude Code, prompt engineering, documentation-first development

EXPERIENCE

Independent Product Developer

2026

- Own product strategy, architecture, implementation, and iteration across two deployed projects.
- Use AI-assisted workflows to accelerate delivery while retaining full ownership of technical decisions and quality.

Previous: Content Moderation & Healthcare Claims Processing

2020 - Present

Built process discipline, decision-making under ambiguity, and documentation accuracy — applied directly to how I approach software development.
